

Two workload properties that motivate CXL Type-2 coherent sharing

(A) Physical host: producer posting 64 B notifications to CXL-attached memory; one fence+readback per batch. (B) Calibrated device model: sharing = one doorbell write + one on-demand device-cache read; publication = push the full object through the link, then doorbell + read.

(A) Batching: 70x on the notification path

(B) Sharing vs. publication vs. replication
